## SCHANGER<sup>®</sup>

## ThreadX PORTING KIT

OS Changer ThreadX<sup>®</sup> Porting Kit is a C/C++ source-level virtualization technology that allows you to easily re-use your software developed using ThreadX APIs on another OS, while providing real-time performance. It eliminates the manual porting effort, saves money and shortens the time to market. OS Changer can also be used to simulate the ThreadX Interface on a host machine. OS Changer Interface connects to your existing application that was developed on ThreadX while the OS Abstractor Target Specific Module (specific to your target OS) provides the connection to the OS you are moving to.

### OPTIMIZED CODE GENERATION: OPTION ONE

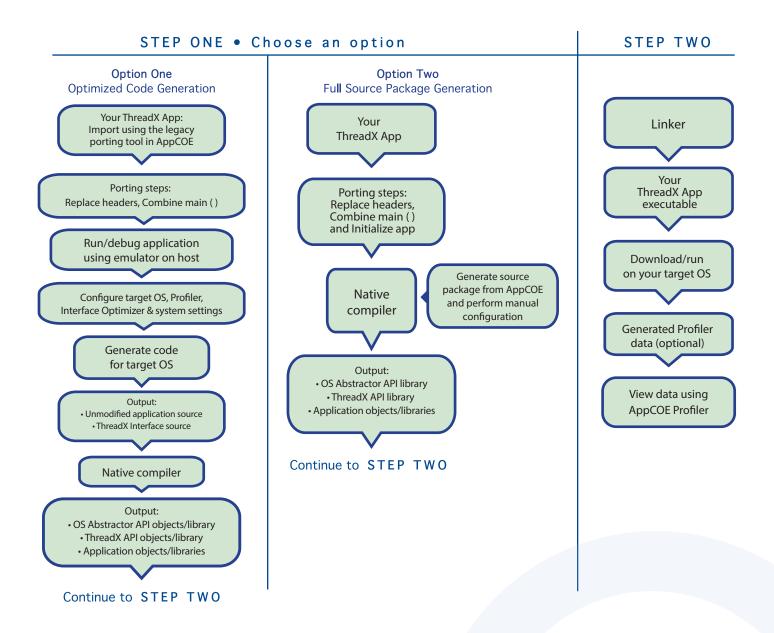

- · Legacy porting tool to easily import your ThreadX applications into AppCOE
- Perform your porting & simulation on Windows/Linux host machine with the provided GNU tools for x86
- Generate optimized ThreadX Interface code for your target, specific to your application
- Generate project files for your target IDE/tools environment
- Enable target profiling of the ThreadX Interface and of the application functions to collect valuable performance data and generate comparative performance reports
- Selectively optimize each ThreadX Interface function for performance based on its usage in your application
- Automatically generate initialization and configuration code based on the settings you chose in the GUI-based wizard

## FULL SOURCE PACKAGE GENERATION: OPTION TWO

- Use with your preferred IDE/tools instead of the AppCOE development environment
- Provides a Porting Kit in a source code format which contains all the ThreadX Interface functions for a specific target OS
- Requires manual configuration and initialization instead of using the AppCOE GUI-based wizard

## ThreadX PORTING KIT

## SCHANGER ThreadX PORTING KIT

### **Technical Highlights**

#### **Includes a Process Feature**

- > Port your application to a single or multiple processes utilizing the user shared region provided for your global variables
- > Create a new process by compiling the application separately or by launching it from your main application
- > Provides software-based process features, even if the underlying target OS does not offer support
- > Applications can pre-allocate heap memory during process creation
- \* Set maximum limits regarding the amount of heap memory each application can use to prevent applications from using up all of the system memory and impacting other applications

#### API Flexibility

- > OS Abstractor APIs also available for use in your ThreadX application
- > OS Changer ThreadX Interface can be used within a single or across multiple applications Thread Pooling
- > Applications can pool threads to increase platform robustness and performance by eliminating the overhead associated with actual task creation and task deletion at run-time

#### **Mission Critical Features**

> Applications have the ability to asynchronously recover from fatal software errors through a soft reset by rolling the stack back to the start of the application

#### **Highly Scalable**

> The AppCOE GUI-based wizard reads your application to custom generate optimized ThreadX Interface code that is specific to your application resulting in increased performance and reduction of memory footprint

#### **Target Hardware Independence**

> Products support any target hardware supported by your target OS architecture, including 32/64 bit & SMP/UP architectures

#### In-house OS Support

> Can easily be extended to support your in-house OS

#### ThreadX Interface API Coverage & Target OS Support

#### You can find the supported ThreadX APIs here:

http://www.mapusoft.com/wp-content/uploads/documents/release\_notes-threadx-APIs.pdf

Below are the target operating systems supported by the OS Changer ThreadX Porting Kit:

| Android®               | LynxOS-178®                | Nucleus®              | µC/OS III™           |
|------------------------|----------------------------|-----------------------|----------------------|
| eCOS®                  | micro-ITRON®               | QNX Neutrino RTOS®    | Unix®                |
| Linux/POSIX            | Freescale MQX <sup>®</sup> | RT Linux <sup>®</sup> | VxWorks <sup>®</sup> |
| LynxOS®                | NetBSD <sup>®</sup>        | Solaris®              | In-House             |
| LynxOS-SE <sup>®</sup> | FreeRTOS™                  |                       |                      |
